

CAP2 Defense — Speaker Script (per slide)

Juan Carlo Catering Management System · 27 slides · target 12–15 minutes before the live demo

Slide 1 — Title: Juan Carlo Catering System · Capstone 2

"Good day, panel. We are CAP IT-2467, presenting the Capstone 2 defense of our Catering Management System for Juan Carlo the Caterer. Capstone 1 delivered 80% of the system; today we present the remaining 20%, the business rules now enforced end to end, everything that changed since our last defense, and the results of our full User Acceptance Testing — followed by a live demonstration of one complete contract lifecycle."

Slide 2 — Table of Contents

"Our presentation follows this flow: a short recap of the client and objectives, what is new since CAP-1, the remaining 20% — our Finance and Reports modules — the business rules, the BPMN of the contract lifecycle, our UAT methodology and results, and finally the system demo."

Keep this under 20 seconds — it's a map, not content.

Slide 3 — Client Organization Profile

"A quick recall: Juan Carlo the Caterer, established 1993, is a premier Philippine catering company serving weddings, debuts, and corporate events through eleven interdependent departments — Sales, Kitchen, Stockroom, Warehouse, Creative, Linen, Logistics, Purchasing, Banquet Staff, and Accounting. Their scale is exactly why paper-based coordination was breaking down."

Slide 4 — Solutions Objectives

"Our general objective was to design and build a centralized Catering Management System that streamlines coordination, enhances visibility, and secures records across all departments — replacing physical forms, manual routing, and verbal follow-ups with one role-based platform. Every feature we show today traces back to this objective."

Slide 5 — Divider: CAP-2

"Everything from this point forward is Capstone 2 work."

Slide 6 — What's New Since CAP-1 (Panel Comments Addressed)

"We treated the panel's comments from the last defense as a requirements list, and every one of them is now in the system. Monetary values are peso-formatted system-wide. Statuses are color-coded at every stage of preparation. Worklists sort by priority — the nearest events float to the top. Every department receives alerts and notifications the moment a contract needs them. Client details are saved before any contract exists, through the tasting record. The signed contract is downloadable as a PDF. Dashboards were revised per role, the stockroom catalog was cleaned up, and the database is populated with realistic scenarios for today's demo."

If asked about "time-bound constraints": deadlines, the 7-day material freeze, 7-day requisition lead time, and payment due dates are all enforced automatically; post-event checking is gated to after the event and blocks contract closure until finished.

Slide 7 — New System Capabilities

"Beyond the comments, CAP-2 added deeper capabilities. The contract lifecycle now shows exactly which department has validated and which is still pending — each department sees its own 'Validated' badge. Payment collection is automated: the system computes every deadline, sends one notification per milestone, and if the final 60% is unpaid two months before the event, the contract goes On Hold automatically — preparation is blocked until payment or a management release. A compliance sweep re-evaluates every contract at startup and every six hours. And operations got real paper trails: the dispatch trip ticket with double counting, the three official requisition forms, and the banquet check-in sheet."

Slide 8 — The Remaining 20%: Scope and Status

"Our paper defined the remaining 20% as enhancements, optimization, and broader testing. Here is our honest status. Delivered: the Finance module, the Reports module, and full UAT across all departments — versus the single-department testing in CAP-1. Embedded in the workflows: the analytics the 20% called for live inside the system — payment aging classification, preparation readiness, and budget utilization are computed live; scheduling conflict prevention covers trucks, drivers, and staff; and the system now records the historical usage data forecasting needs. Future work: the forecasting model itself, route planning, mobile optimization, and the post-implementation evaluation, which by definition happens after deployment."

This slide is your shield: every item from the paper's 20% appears here with a status. Don't oversell — 'delivered, embedded, or scheduled' is the frame.

Slide 9 — Divider: Completed Items That Make the 20%

"The two modules we completed for the 20% — Finance and Reports."

Slide 10 — Finance Module

"The Finance module manages and monitors client payments across the whole transaction: the ₱30,000 reservation fee, the 40% initial collection, the 60% final balance, and payment statuses. It also carries the internal side: monthly departmental budgets that Accounting prepares and activates, and which every purchase request is checked against — no active budget, no approval. Activation is stamped with who approved it and when."

If asked when budgets are allocated: a finance officer prepares and activates each month's budget before the month starts; the system enforces it automatically against the month an item is needed. Amounts are configurable — the control is the deliverable.

Slide 11 — Reports Module (Purpose)

"The Reports module gives management consolidated views of operations: sales, payments, events, inventory, procurement, and financial summaries — real-time, drawn from the same records the workflow produces."

Slide 12 — Reports Module (Features)

"Reports generate automatically, can be filtered by date, searched, exported, and printed. And beyond this page, the most valuable processed data lives inside the workflow itself — aging classifications, readiness percentages, and budget utilization are all computed analyses you will see operating in the demo."

If the adviser repeats "too simple / raw data": agree the page aggregates rather than dumps, then pivot to a computed artifact on screen — the aging badge or budget utilization — and name trend analytics as the next layer on data the system already records.

Slide 13 — Divider: New Business Rules

"The business rules, validated with the client, grouped along the contract lifecycle."

Slide 14 — User Access & Contract Management

"Access is role-based — every user sees only their department's modules, and notifications persist on every page. Menu tastings run on hourly slots, ten to five, one booking per slot, up to ten guests, and only a completed tasting converts into a pre-filled contract. Contract creation requires complete client information, checks inventory availability against the event date, suggests alternatives on shortages, and records the non-refundable ₱30,000 reservation fee as part of the 40%."

Slide 15 — Contract Processing & Payment

"Before signature, every concerned department must validate its own section, and Sales can only confirm the payment term after those validations. Contracts are signed physically or electronically, then forwarded to Accounting. Collections follow two independent clocks: the 40% is due two months after booking, with reminders a month ahead and a 30-day aging window to uncollectible; the 60% is due two months before the event — and an overdue balance puts the contract On Hold automatically. No overpayment is ever accepted."

Slide 16 — Operations & Inventory

"After approval, all departments prepare in parallel. Purchasing follows 'no signature, no request, no release' with a 7-day lead time and an emergency path. Materials freeze seven days before the event. Inventory prevents same-date double-booking, monitors minimum stock, and suggests alternatives. Logistics assigns vehicles and drivers conflict-free, loads the day before, and accounts for every item with double counts on the trip ticket."

Slide 17 — Event Completion & Automation

"After the event: every item is inspected, incidents are reported with severity and quantity, logistics marks completion, and the contract can only close when four conditions hold — event done, one hundred percent paid, logistics completed, and all checks finished. The timeline on the right is enforced by the automatic compliance sweep, not by anyone's memory."

Slide 18 — Divider: BPMN

"The full lifecycle as BPMN."

Slides 19–20 — BPMN Diagrams

"One contract lifecycle across swimlanes: booking to contract creation with the department validation gateway; then parallel pre-event preparation gated by payment; then post-event checks with the incident gateway, ending in contract closure. These same three phases structure our live demo."

Point at the gateways: 'Validated?', the payment gate, and 'Any damage or missing items?' — the three decision points the panel will see live.

Slide 21 — Divider: User Acceptance Testing

"How we validated the system with Juan Carlo's actual staff."

Slide 22 — About the UAT

"Unlike CAP-1's single-department test, this UAT covered all ten departments. Department personnel simulated their real day-to-day scenarios on the system rather than following rigid scripts, with role-based access enforced throughout, and evaluated it through an online Google Forms instrument. Respondents were representatives from every department — about one-third of the users per department."

If pressed for an exact headcount, refer to Appendix R (UAT Answers) of the paper rather than guessing a number on stage.

Slide 23 — Overall Findings

"The majority of respondents selected Strongly Agree across all evaluation criteria. The system was rated user-friendly, reliable, and easy to use, and respondents confirmed it improved interdepartmental communication and workflow efficiency, with no major errors or crashes during testing."

Slide 24 — Highest-Rated Criteria

"System Interface and Navigation and Daily Task and Interdepartmental Coordination both scored 4.83 out of 5; Event Tracking 4.74; Workflow Clarity, our lowest, still 4.63 with most respondents at Strongly Agree."

Slide 25 — Department Feedback

"Sales, Accounting, and Administration praised contract routing and financial monitoring; the inventory departments highlighted centralized tracking; Logistics and Banquet commended scheduling and dispatch."

Slide 26 — Suggested Improvements

"Users also gave constructive feedback: laundry tracking for linen, better form contrast, and richer notifications for pending contracts. We implemented these before this defense — which the demo will show — turning UAT feedback directly into system refinements."

Slide 27 — System Demo

"We now demonstrate one complete contract lifecycle — booking, validation, signature, collection, parallel preparation, procurement with budget approval, and post-event closure — with each of us driving our own departments."

Hand off to the demo order agreed with the team; keep the Defense Demo Guide PDF beside you for the per-stage steps and expected outcomes.
