

Capstone 2 Defense — Demo Guide & Script

Juan Carlo Event Management System · One full contract lifecycle with business rules, panel comments, and the 20% (Finance & Reports) mapped to every stage

How to use this guide. Follow the stages in order — together they walk one contract from inquiry to closure. Each stage lists what to do on screen, which business rules it proves, which panel comments or 20% items it covers, and the expected outcome so you know it worked. Special situations that cannot be shown on a single contract (payment hold, aging, closure) use pre-generated contracts listed in Section 2 — generate them before defense day.

1. Demo accounts

Login	Password	Used in
sales@juancarlos.com (the AE)	password123	Stages A, B, D
creative@ / linen@ / stockroom@juancarlos.com	password123	Stage C (validation), F (preparation), H (post-event)
accounting@juancarlos.com	password123	Stages E, G (budget approval), H (closure), Finance module
kitchen@ / banquet@ / logistics@juancarlos.com	password123	Stage F (preparation)
purchasing@juancarlos.com	password123	Stage G (procurement)
admin@juancarlos.com	admin123	Hold release, backup for anything

Role-based access is itself a business rule — logging in as different people during the demo *is* the proof. Point out that each login sees a different sidebar.

2. Before defense day — contracts to generate

Ask Claude for each of these (exact phrases below). Each request wipes and rebuilds its own demo data, so run them the night before or the morning of the defense for a clean state. None of them touch your teammates' data.

Ask Claude	What you get	Used to demonstrate
reseed the procurement demo	DEMO-PROC-PRACTICE and DEMO-PROC-ADVISOR — two identical approved contracts, each with its own stockroom item short by 25 (needs 30, only 5 in stock)	Stage G: the entire procurement loop — shortage → request → budget → approval → proof → inventory refill. Practice on PRACTICE; show ADVISOR live.
generate the validation demo contract	DEMO-VALIDATION — a draft contract with creative, linen, and stockroom items, none validated yet, payment term unconfirmed	Stage C without filling the whole form live: department badges (Awaiting Department Validation → Validated), payment-term gate, Send For Signature unlock. Also your safety net if the live contract creation in Stage B goes wrong.
generate the hold demo contract	DEMO-HOLD — approved, 40% paid, event ~6 weeks away so the 60% deadline (2 months before) has already passed → automatically On Hold	Stage H1: Final Balance Overdue / On Hold — red banner, blocked preparation, settle-or-release, no auto-cancel, no auto-refund.
generate the aging demo contract	DEMO-AGING — signed ~2.5 months ago with no 40% collected → sits inside the 30-day aging window (plus an optional uncollectible variant booked >3 months ago)	Stage H2: collection timeline — follow-up and collection-task notifications, aging status, uncollectible flag.
generate the closure demo contract	DEMO-CLOSE — approved, 100% paid, event date already passed, all items still pending post-event check, logistics dispatched	Stage H3: post-event checks, incident report, logistics completion, Close Contract with all four closing conditions.
populate extra demo data for the defense	Additional tastings, contracts in assorted stages, and notifications so dashboards look alive	Panel comment “Populate your database to better simulate scenarios.”

Also before the demo: (1) restart the backend once — the compliance sweep runs on startup, which freshly applies holds/notifications (a business rule you can quote: “sweep on startup and every 6 hours”); (2) make sure an **active finance budget exists for the month your procurement request is needed in** — check Finance in the Accounting area. If it's missing, the budget approval will refuse (which is correct behavior, but not what you want mid-demo).

3. The lifecycle script

Stage A — Menu tasting (login: sales)

RULES

COMMENT: pre-draft saving

1. Menu Tastings → **Book Tasting**. Pick a time slot — point out slots run hourly 10 AM–5 PM and a taken slot disappears (one booking per slot per day). Set pax to 10 and try 11 to show the 1–10 guest limit.
2. Save, open the booking → **Confirm Booking**.
3. On the tasting day (use a booking dated today from the populated data): **Record Feedback** — stars + comments → status flips to *Completed*. Say: “A tasting is only completed once feedback is recorded.”
4. **Create Contract** from the completed tasting — the form opens pre-filled.

Expected: slot vanishes from the picker; feedback marks Completed; contract form arrives pre-filled from the booking.

Covers the comment “Allow saving details prior to contract creation” — the tasting record *is* the pre-draft: client details are captured and reusable before any contract exists.

Stage B — Contract creation (login: sales)

RULES

1. Walk the tabs: Client Info → Event Details → Package & Menu → Add-Ons → Summary. Pick an event date **at least 3 months out** (keeps every payment deadline in the future).
2. On Package & Menu, try to add a 4th main dish on a Basic package → blocked. Say: “Package menu limits are enforced, not just suggested.”
3. On Add-Ons, point at an item's availability figures — they are computed **for the event date**, minus what other same-day events reserved. If an item is short, the system suggests alternatives right there (alternative forecasting).
4. On Summary, point at the ₱30,000 reservation fee note: non-refundable, forms part of the 40%. Save as draft.

Expected: menu over-limit rejected; date-based availability + alternatives visible; draft saved with the stage badge *Awaiting Department Validation*.

Stage C — Department validation (logins: creative → linen → stockroom → sales)

RULES

COMMENTS: notifications · status colors

1. Use DEMO-VALIDATION (or the Stage B draft). As **creative**: open the contract → Inventory tab → confirm the creative section. Show that the badge this user now sees is green *Validated* while other departments still see amber *Awaiting Department Validation* — role-specific validation, made visible.
2. Repeat for linen and stockroom (or narrate it after doing one live).
3. As **sales**, show that **Confirm Payment Term** was locked until all validations were done, then confirm it. Badge moves to *Confirm Payment Term → Ready For Signature*.
4. Open the bell: each hand-off generated a notification for the right department. Say:
“Notifications are persistent, per department, and deep-link to the exact tab.”

Expected: payment-term button refuses before validations; stage badge changes color at every step (the panel's “use colors for preparation status” comment); bell shows unread items.

Stage D — Signature (login: sales)

RULES

COMMENT: downloadable signed contract

1. **Send For Signature** (only unlocked because every section is validated — hover shows what would block it).
2. Use **E-Sign PDF** → upload/draw both signatures → **Save Signatures And Open PDF** — the signed contract downloads as a PDF. This is the panel's “contract with signature should be downloadable,” answered literally.
3. **Mark Client Signed** → contract is forwarded to Accounting automatically (watch the notification).

Expected: a signed PDF in the downloads bar; status *submitted*; Accounting notified.

Stage E — Payment collection & approval (login: accounting)

RULES **COMMENT:** peso formatting

1. Open the contract → Payments tab. Point at the peso signs and the peso icons — “all monetary values are formatted in Philippine Peso” (their exact comment from last defense).
2. Try **Record Payment** above the remaining balance → rejected (no overpayment). Record the 40% properly with an OR number.
3. Narrate the timeline (it's printed on screen): 40% due 2 months after booking, reminder a month earlier, 30-day aging to uncollectible; 60% due 2 months before the event. Payments could not be recorded at all before signature.
4. **Approve For Preparation** → every preparing department gets notified at once.

Expected: overpayment blocked; approval succeeds only with signature + 40% + no uncovered shortages; department notifications fan out.

Stage F — Parallel preparation (logins: kitchen, banquet, logistics, + one inventory dept)

RULES **COMMENTS:** priority sorting · status colors · relevant dashboards

1. **Kitchen:** dashboard checklist → tick dishes → **Mark Ready** (refuses until every item is ticked). Print the Kitchen Checklist.
2. **Banquet:** Banquet tab → Load Recommended Plan (auto-assigns available staff) → Save → **Print Staff Check-In Sheet** (Time In/Out, signatures).
3. **Logistics:** Logistics tab → assign truck + driver (the recommended match respects same-day conflicts) → **Print Trip Ticket** — fleet guideline (1 truck per 100 pax + small vehicle), loading day = event – 1, double-count columns, variance, photo-evidence checkbox.
4. **Creative/Linen/Stockroom:** mark items *prepared* on the Inventory tab; open the contract's Preparation Readiness panel — per-department colored chips and a % bar.
5. On any department dashboard, point at the queue tabs (“This Week” first) and sorting — events nearest their date float to the top. That is the “sort by priority” comment.

Expected: Mark Ready gated on the checklist; printed forms carry the company letterhead; readiness chips change color as departments finish.

Stage G — Procurement + Finance (the 20%) (logins: stockroom → purchasing → accounting)

20%: FINANCE RULES

Use **DEMO-PROC-ADVISOR**. Script (each step is one login/screen):

1. **stockroom:** contract → Inventory tab → the chair shows *Stock shortage* (Need 30 / Available 5) — the request button exists *only because* a real shortage exists. **Request Purchasing Or Rental**, Date Needed = **Jan 5, 2027**, send.
2. Try a Date Needed 3 days from now on a standard request → blocked: 7-day lead time. Say: “Inside the window you must file an Emergency Requisition instead — 1-to-3-day handling.” Then use the January date.
3. **purchasing:** Needs Budget Request → **Create Budget Request** — supplier, unit price 350, expected fulfillment Jan 8 → total ₱10,500. **Print Requisition Form** — the official form with the full signature chain.
4. **accounting:** Procurement Approval → the approval refuses until all four checklist boxes are ticked, and it checks the request against the **active monthly finance budget** for January (stockroom allocation ₱40,000 → ₱10,500 fits). Approve. Say the rule out loud: “*No signature, no request, no release.*”
5. **purchasing:** Budget Approved → **Submit Proof Of Purchase** (invoice ref INV-DEMO-0001, qty 30).
6. **accounting:** Confirm Expense → request Completed. Open Stockroom Inventory: the chair jumped **5** → **35**. The loop closed itself.
7. Finish in the **Finance module:** show the monthly budget per department, its utilization after this purchase, and the approval trail (who activated the budget and when).

Expected: lead-time rejection; checklist-gated approval; budget-gated approval; automatic inventory refill; budget utilization visibly increased.

Stage H — Special cases (pre-generated contracts)

RULES

COMMENT: time-bound constraints

H1 · DEMO-HOLD (login: accounting, then admin). Open it: red *Final Balance Overdue / On Hold* banner. As kitchen or logistics, try any preparation action → “This contract is on hold.” Two exits: record the remaining balance (hold lifts instantly) or admin's **Release Hold (Management)** with a justification note. Say: “No automatic cancellation, no automatic refund — refunds need a cancellation letter, management review, and a costing; Food-To-Go is the alternative offer.”

H2 · DEMO-AGING (login: accounting). Show the accounting dashboard flags: the 40% follow-up notification, the collection task, the aging badge, and (on the older variant) *uncollectible*. These were generated automatically by the compliance sweep — one notification per milestone, never duplicated.

H3 · DEMO-CLOSE (logins: an inventory dept → logistics → accounting). Event already happened: every item shows *Pending Post-Event Check*. Mark one *Checked and Returned*; on another click **Report Incident** (severity + quantity — the burnt-tablecloth scenario). Logistics: **Mark Completed**. Accounting: **Close Contract** — hover it first while a check is missing to show it refuses, then finish the checks and close. Recite the four closing conditions: event passed, 100% paid, logistics completed, all checks done.

Expected: hold blocks preparation server-side; sweep-generated notifications exist without anyone clicking; Close Contract is impossible until all four conditions hold.

Stage I — Reports (the other 20%) (login: admin or accounting)

20%: REPORTS

Open Reports last, framed by everything the panel just watched: “Every number here was produced by the workflow you just saw.” Walk contracts summary, payment collections vs. outstanding, department activity. Then open the Finance overview: budget vs. actual per department, recent expenses with invoice references, the approval queue. See Section 6 for how to answer the “too simple” comment.

4. Comments & 20% — coverage map

Panel comment (last defense)	Status	Where it's shown
Properly format monetary values (peso signs)	Done	Stage E — Payments tab, accounting dashboard, all printed forms (₱, en-PH formatting, peso icons)
Sort lists according to priority (inventory prep for events)	Done	Stage F — “This Week” queues, nearest-event-first sorting on every department worklist
Alerts and notifications per department after contract signed	Done	Stages C–E — bell with unread count, per-department fan-out on signature/approval, deep links
Populate database to simulate scenarios	Done before defense	Section 2 — pre-generated contracts + populated data request
Use colors to differentiate preparation status	Done	Stages C & F — colored stage badges (amber/violet/teal/green/red) and readiness chips
Determine the best way to show information	Done	Stage F — queue tabs, summary cards, sort dropdowns, role-filtered dashboards
Allow saving details prior to contract creation	Done	Stage A — tasting booking stores client/event details; contract pre-fills from it; contracts save as drafts
Contract with signature should be downloadable	Done	Stage D — E-Sign PDF export
Review and revise dashboards; keep contents relevant	Done	Stage F + role logins throughout — each role sees only its own modules
Removal of irrelevant inventory in stockroom	Done	Stockroom Inventory page — cleaned catalog; stockroom-only management access
Time-bound constraints (e.g., post-event check within the day)	Partially — reframe	Time-bound constraints exist throughout (7-day lead time, 7-day freeze, payment deadlines, hold). Post-event checking is gated to start only after the event and blocks closure until finished — enforced by dependency rather than a same-day timer. If pressed: a same-day deadline notification is a small addition to the existing sweep.

5. Business rules outside the system's scope

Say these confidently — hiding them is worse than owning them. The pattern for each answer: *“That is a human/managerial process; the system supports it with X but doesn't automate the decision.”*

Rule	Status	What to say if asked
Sales Manager review before Accounting	Not a separate system step	The review happens inside Sales before “Mark Client Signed”; the system records who confirmed each section, which is the audit trail of that review.
Department readiness reports	Replaced by a live equivalent	Instead of submitted documents, the Preparation Readiness panel computes readiness live per department — a report that can never go stale.
Final client meeting (1 month before)	Manual, system-supported	The final-details deadline and SLA warning at event – 1 month exist to trigger that meeting; the meeting itself is human.
Food audit before service	Manual	Operational kitchen QA on event day; the system's kitchen checklist covers preparation, not on-site tasting.
Photo evidence of returns	Paper-supported	The trip ticket carries a photo-evidence checkbox and sign-offs; the photos live on the phone/printout. In-app upload is a planned enhancement.
Refund computation & Food-To-Go conversion	Manual by policy	Deliberately manual: refunds need a cancellation letter and Execom costing. The system's job is to <i>prevent</i> wrong automatic outcomes — no auto-cancel, no auto-refund, hold instead.
Client feedback after the event	Manual	Feedback is systematized at the tasting stage; post-event feedback is collected by the AE. An in-app survey is future work.
AE commission computation	Not implemented	Payroll territory. The system provides its prerequisite — verified 100% collection per contract — from which commissions are computed externally.
Demand forecasting from historical usage	Foundation only	The system records the data forecasting needs (usage, shortages, purchases). The forecasting model itself is future work — see Section 6.

6. Defense Q&A — scripted answers

Q: “When is the monthly budget allocated? What's the basis for the amounts?”

“Budget allocation is a controlled manual step, not an automatic one — that's deliberate. Before a month starts, the finance officer prepares that month's budget in the Finance module: a total, and per-department allocations that cannot exceed it. Activating it stamps who approved it and when. What is automatic is enforcement: every purchase request is checked against the active budget of the month the item is needed in — no active budget or not enough allocation, and Accounting cannot approve it. The default figures are a seeded template reflecting each department's replacement intensity — decor, linen, and equipment carry the largest replacement costs, so Creative ₱50k, Linen ₱45k, Stockroom ₱40k, down to Admin ₱10k, with a contingency line — but they're placeholders by design. The client's finance officer sets the real numbers monthly; our deliverable is the control, not the amounts.”

If pressed on “why manual?”: budgets depend on collections and management decisions that month — auto-allocating would fabricate a business decision the system has no authority to make. The 'source of funds' field (client collections / monthly allocation / management approved) exists exactly because the client funds months differently.

Q: “Your finance module isn't aligned with the client's actual finance rules.”

“We validated the collection side of finance with the client in detail — the ₱30,000 reservation fee, the 40/60 split, the aging window, the hold policy — and those are fully enforced. For internal budgeting, we could not complete a second validation round with the client's finance officer within Capstone 2's timeline, so we implemented the industry-standard control instead: monthly departmental envelope budgeting with approval gating — 'no signature, no request, no release,' which the client did state. Every parameter — amounts, categories, funding source — is configurable, so aligning it to their exact figures is a configuration exercise, not a redesign. That's the honest boundary of this iteration, and we've scoped the validation session as the immediate next step.”

Q: “The reports are too simple — just raw output of data.” (adviser's comment)

“That was fair feedback, and we addressed it in two ways. First, the most valuable 'processed data' in this system doesn't live on the Reports page — it lives in the workflow: the payment aging classification, the per-date inventory availability with alternative suggestions, budget utilization against allocations, preparation-readiness percentages, and SLA statuses are all computed analyses, and you saw each of them operate during the demo. Second, on the Reports page itself, figures are aggregated — collections versus outstanding, status distributions, department activity — rather than record dumps. Where we agree there's room to grow is trend analytics: month-over-

month collection curves and demand forecasting from the usage history the system already records. The data model was built so that layer drops in without schema changes."

Tactic: whenever the panel says "reports," pivot to a computed artifact you can show in 5 seconds — the aging badge, the budget utilization bar, the readiness percentage. It reframes "reports" from a page to a capability.

Q: "Why does a missed final payment put the contract on hold instead of cancelling it?"

"Direct instruction from the client's rules: cancellation and refunds are management decisions with a costing process — a couple breaking up is not a valid refund reason, a death in the family may be. So the system does what it's authorized to do: it stops the company from spending on preparation for an unpaid event, notifies collections, and waits for either payment or a management release with a justification note. The reservation fee is never refundable, and the 40% is never automatically refunded."

Q: "What's your reference for [timeline/rule X]?"

"Chapter 3 of our paper documents the client interviews; the operational rules — the ₱30,000 fee, 40/60 schedule, aging window, 7-day lead time, material freeze, the 1-truck-per-100-guests guideline — come directly from those interviews and are listed in our Business Rules document. Each is implemented as a named constant in the system, so the rule in the paper, the rule in the document, and the rule in the code match one-to-one."

Q: "What happens if two events on the same day need the same items/staff/trucks?"

"Availability is computed per event date, not from raw stock: a second same-day event sees only what's left, gets a shortage alert plus alternative suggestions, and the trip-ticket and staffing recommendations exclude drivers, trucks, and staff already committed that day. Seven days out, the material freeze locks assignments completely."

Q: "Who can override things, and is it audited?"

"Only management (admin) can release a payment hold, and it requires a note; budget activation stamps approver and time; section validations record who confirmed and when; payments carry OR numbers and recorder identity. Every override leaves a name."

7. Timeline quick card (keep beside you)

When	Rule
Booking day	₱30,000 reservation fee — non-refundable, counts toward the 40%
Booking + 1 month	40% follow-up reminder (automatic)
Booking + 2 months	40% due — collection task fires
+ 30 days after 40% due	Aging ends → uncollectible
Event – 3 months	60% reminder window opens
Event – 2 months	60% due — unpaid → automatic On Hold (blocks all preparation)
Event – 1 month	Final details deadline / SLA warning (final client meeting)
Event – 7 days	Material freeze; standard requisitions need 7-day lead (else Emergency, 1–3 days)
Event – 1 day	Equipment loading (printed on the trip ticket)
After event day	Post-event checks unlock; closure needs: event passed + 100% paid + logistics completed + all checks done
Always	Compliance sweep on server startup and every 6 hours; one notification per milestone

Juan Carlo Event Management System · Capstone 2 defense guide · Generated from the implemented system — every expected outcome in this document was verified against the running application.
